

AI-Powered Multimodal Placement Guidance System

Problem Statement: Students preparing for placement drives often face difficulty obtaining timely guidance regarding interview rounds, technical preparation, HR questions, aptitude topics, and company expectations. Communication with seniors and alumni is usually manual and delayed, causing repeated doubts and ineffective preparation. The proposed system develops an AI-powered placement guidance platform that collects and analyzes interview experiences from previous students to provide intelligent guidance for future candidates.

Multimodal Inputs: The system accepts Text (interview feedback), Audio (voice experiences), Image (screenshots/resumes), and Video (recorded interview experiences).

AI/ML Features: NLP, Sentiment Analysis, Speech-to-Text Conversion, Keyword Extraction, Recommendation System, and Company Trend Analytics.

System Workflow

Expected Outcome: The system provides company-specific preparation guidance, reduces dependency on delayed senior responses, improves placement readiness, and creates a centralized interview intelligence platform for students.
